Pregnancy Planning & Vasculitis - Discussion Guide for Patients and Their Providers

This handout can guide conversations between patients and providers. Patients should discuss with a medical professional before making medical decisions.

Is Your Vasculitis Well Controlled?

Discuss with Your Rheumatologist

START HERE

Minimal signs of inflammation

 Minimal blood and protein in the urine (if applicable)

No disease activity requiring an increase in prednisone ("steroids") in the last six months

Stable kidney, heart, and lung disease (if applicable)

Pregnancy Compatible

Strongly Recommended

Azathioprine (Imuran®)

Certolizumab (Cimzia®)

Colchicine (Colcrys, Mitigare®)

Hydroxychloroquine (Plaquenil®)

Low dose Aspirin

Prednisone (use sparingly)

Pregnancy Compatible

Conditionally Recommended

Cyclosporin/Tacrolimus (monitor blood pressure)
Infliximab, Etanercept, Golimumab, Adalimumab
(discontinue several weeks prior to delivery in
certain cases)

NSAIDs (Meloxicam, Ibuprofen, Naproxen, etc.)
Rituximab (only in very active disease)

Insufficient Information

Abatacept (Orencia®)

Anakinra (Kineret®)

Apremilast (Otezla®)

Avacopan (Tavneos®)

Baricitinib/Tofacitinib/Upadacitanib (Olumiant®/Xeljanz®/Rinvog®)

Benralizumab (Fasenra®)

Dupilumab (Dupixent®)

Mepolizumab (Nucala®)

Secukinumab/Ustekinumab

(Cosentyx®/Stelara®)

Tocilizumab (Actemra®)

Pregnancy Incompatible

Cyclophosphamide (Cytoxan®)

Methotrexate

Mycophenolate Mofetil (MMF, CellCept®)

Which Doctors Should be Involved?

This Depends on Your Disease Manifestations

Rheumatologist	Pulmonologist
Cardiologist	Otolarvngologist

■ Nephrologist ■ Hematologist ■ OB/GYN ■ Dermatologist

■ High-Risk OB/GYN (Maternal Fetal Medicine, Perinatologist)

Primary Care Practitioner

Are Your Medications Appropriate for Pregnancy?

	Continue	or start	Pregnan	cv Com	natible	medicatio	ns
	Continue	ui stait	riegilali	LY CUIII	patible	IIIEuicatio	113

Switch from **Pregnancy Incompatible** medications (that may cause birth defects) to **Pregnancy Compatible** medications

If prednisone ≥ 10 mg is needed, then add or increase Pregnancy Compatible medication

Discuss other medications with your doctors

If possible, discuss medication changes at least 6 months

prior to pregnancy.

Minimizing Pregnancy Complications

Reported pregnancy complications in women with vasculitis include hypertension, low birth weight, preeclampsia, and preterm delivery. The risk of these complications is dependent on:

- the use of pregnancy compatible medications to control disease
- prior damage from vasculitis
- type of vasculitis
- vasculitis activity in pregnancy
- medications that cause birth defects

Work closely with your medical team to plan your pregnancy and manage your disease. Following the above steps may minimize your risk of experiencing these complications.

- Cytoxan® and Thalidomide need to be held if male patients want to conceive with their partner
- Male patients taking Cytoxan® should NOT attempt conception or sperm collection during or three months after treatment
- Because Cytoxan® can cause infertility, it is recommended to complete sperm collection or egg harvesting prior to initiation
- Co-administration of ovarian protecting medications with Cytoxan® may decrease female infertility
- Consider consulting with a reproductive endocrinologist if you are having difficulty conceiving

Birth Control and Vasculitis

Discuss the following with your doctor

 Patients at high risk for thrombosis (blood clots) should not take birth control containing estrogen

Work with the following doctors to decide which birth control plan is the best fit for you

- Primary Care Physician (PCP)
- Rheumatologist
- Gynecologist (GYN)

What about emergency contraception (Plan B)?

- It can be used by ALL women, even in those with history of blood clots, lupus, or vasculitis
- It can be used up to three days after unprotected sex or failed birth control
- No prescription is needed; can pick up from a pharmacy or Amazon.com
- Your GYN can provide options for emergency contraception up to five days after unprotected sex

What are my Birth Control Options with Vasculitis?

Highly Effective < 1% Pregnant Each Year

Tubal Ligation

Subdermal Implant (Nexplanon®)

Intrauterine Device (hormonal and non-hormonal)

Less Effective 6-9% Pregnant Each Year

Depo-Provera®**

Pill with Estrogen**

Vaginal Ring**

Patch**

Mini Pill

Least Effective 10-25% Pregnant Each Year

Diaphragm

Sponge

Cervical Cap

Spermicide

Fertility Awareness
("the rhythm method", tracking ovulation)

**Should not be used in patients at risk for blood clots or have a history of blood clots

Birth Control Options for Male Patients

Highly Effective < 1% Pregnant Each Year

Vasectomy

Least Effective 10-25% Pregnant Each Year

Condom

Withdrawal Method

Fertility Awareness
